02 Sign in and find your items
03 Capture, review and save
04 Sports cards and gem records
05 Maintain, value and sell
06 List a batch and print labels
07 Tools, Lookups and help

01 / PRACTICAL WORKFLOW

Sign in and find your items

The Collectibles screen is your starting point for inventory, filters and settings.

1. Open your account

Choose **Continue with Apple**, **Continue with Google**, or **Continue with email**. Google may use an account picker or a secure browser tab; Apple uses a browser flow. Use **Forgot password?** if needed. Confirm a new email account using the Reliqra email, then let workspace setup finish.

2. Use the five tabs

Collectibles is your inventory. **Add (+)** captures an item. **Lookup** has Photo, Price and Cert research. **Tools** holds utilities and maintenance. **Search** finds inventory. Open the **three-dot menu** on Collectibles for data actions and Settings.

3. Search and filter

Search for the title or PID and use the inventory filters to narrow the list. Active count chips and status filters can hide a record, so clear them when troubleshooting. Open a row to inspect that item rather than relying only on a list total.

4. Check status deliberately

The PID identifies the Reliqra record. Reconciled means the item is physically checked or accounted for; it is not a marketplace listing status. Check Sold, Active and other statuses before editing or exporting a batch.

Use the **same sign-in method and workspace** on every device. Apple Hide My Email can create a different account from your usual email address. If your items or plan seem missing, check the account and workspace before adding data or purchasing again.

02 / PRACTICAL WORKFLOW

Capture, review and save

Add is a capture-first workflow. You remain responsible for confirming the item and its details.

1. Choose the type and photos

Tap **Add (+)**, choose the item type, then capture the front and back. The camera offers framing for slabbed and raw coins, cards, comics, currency, proof sets, bullion and gems. Pinch or drag to correct a crop; use **Retake** or **Use photo** to decide. **Gem details are typed in by hand**; gems have no photo identification.

2. Review the suggested identity

Identification can auto-fill the form. Check the title, type, year, grade, grader, serial and type-specific details against the item. Use **Enter details manually** when appropriate. Changing item type can clear fields belonging to the old type, so review the form again.

3. Complete the record

Open the relevant editor sections for identity, photos, valuation, financials or marketplace details. Resolve required-field warnings. Check quantity: a graded or certified unit stays at 1. Set **Quantity**, then check the **Availability** row on the saved item.

4. Inspect Finish and Save

Review label, export and marketplace choices and the destination after saving. Read the saved receipt to see what actually completed. A saved item, a queued listing and a live listing are different outcomes. Verify any marketplace result separately.

Use Lookup for research

In **Lookup**, select Photo, Price or Cert and read the cost before continuing. Separate identification and pricing actions may each use a Lookup. **Add to Inventory** or **Add to Wanted** opens a pre-filled form; nothing is saved until you save that form.

03 / PRACTICAL WORKFLOW

Sports cards and gem records

Choose the right identification route. A saved record should describe your exact item, not the closest-looking result.

1. Select the sport

Open **Add > Card** and set **Sport / Game** to the sport, such as Baseball. Frame the card clearly and run the identification action. Check the front-image consent prompt before continuing.

2. Confirm the match

Review CardSight's proposed matches against the player, year, set, number, parallel and printing. Choose the correct match before continuing to save. If the match is wrong, **Find Another Version** searches CardSight's catalog for other versions of that card. Do not accept a near match; correct the details or use the explicitly metered AI option when appropriate.

3. Read Graded Values

In Graded Values, **Sold** is CardSight's completed-sale median for the exact grader and grade. **Est.** rows are modeled estimates, not recorded sales or appraisals. **Any Grader estimate bands are not specific-grader comps.** Check the exact card version, grade band, source and dates. Neither figure guarantees sale proceeds or a grade for a raw card.

Know the cost

CardSight covers **baseball, basketball, football, hockey, soccer and MMA**. It is included with Pro, fair use applies. On Free, a scan that finds a match uses **1 Lookup**; a scan with no match is free. Other cards, or **Identify With AI** chosen after no match, use **1 Lookup on every plan**.

Enter a gem by hand

Choose **Add > Gem**. Fill in **Gem Type, Carat, Cut, Color, Clarity and Origin**, then review and save the record. Gems support manual records, Wanted lists, import and labels. They do **not** have photo identification, a Greysheet or CardSight price, or an eBay CSV row. A saved gem can load eBay sold comps (1 Lookup on Free), and a gem with its Origin set can be listed on Whatnot.

> CardSight runs after you agree to send the card's front image. CardSight may keep that image and use it to improve its models. You can withdraw that choice for future scans. Review the Privacy Policy before agreeing.

04 / PRACTICAL WORKFLOW

Maintain, value and sell

The item detail screen separates everyday facts from the deeper record.

Open the detail sections

Tap an item, then open **Photos**, its **Details** row (such as Coin Details or Card Details), **Valuation**, **Financials**, **Composition & Melt**, **Certification**, **Inventory Record** or **Marketplace Export**. Rows depend on the item type. Use **Edit** to make a correction.

Read a valuation

Check the source and date before using a guide price. For melt, verify metal, weight, fineness and the spot timestamp; update missing inputs instead of typing a guessed metal value. Wholesale Greysheet Bid/Ask depends on your own eligible Greysheet connection.

List an eligible item on eBay

Use **List on eBay** or **Manage eBay Listing** for an eligible inventory item. Complete connection, inventory location and policy checks. Review category, required condition and item specifics, photos, quantity, price and shipping. Controls depend on installed version, role and connection. Verify the live result on eBay. See the eBay Selling guide.

Mark sold and reconcile

Mark as Sold asks for the sale date and price. Check both before confirming. If the item remains live elsewhere, end that marketplace listing and verify it. Printed-label QR actions can help open or reconcile the right record, but do not replace that check.

Export and back up

Open **Collectibles > three-dot menu > Data > CSV Tools**. Choose **eBay Coins, Cards or Comics** for separate files, not a mixed-type CSV. Coins includes known-issuer coins and Bullion with Form set to Coin. Cards/Comics have their own identity and condition requirements. Check items, quantities and any skipped-item reasons. Currency/notes, proof sets and gems are excluded. Downloading does not publish or guarantee eBay acceptance. Review the file, import it and check accepted/rejected results.

> AI identification, price guides and sold comparisons are research aids, not an appraisal or a guarantee of sale price. Check the exact item, grade, variant and source date. Melt is the value of the metal content at the displayed spot price, not the collectible's market value.

05 / PRACTICAL WORKFLOW

List a batch and print labels

Prepare the records first. Marketplace publication and physical printing are separate results to verify.

1. Prepare the Whatnot connection

Connect your own Whatnot seller account in **Reliqra Cloud > Settings > Connections**, following the current panel's setup instructions. Once connected, Whatnot orders and sold items sync on Reliqra's servers with no browser open. Keep credentials private. Return to the mobile app in the same Reliqra workspace.

2. Select and list

In **Collectibles**, open the **three-dot menu > Select For Whatnot**. Select eligible items, then choose **List on Whatnot**. Each listing is a **Buy It Now listing in your Whatnot profile shop**, not a show or auction. Review the selected count and each item before confirming. Items must be Active, titled, photographed and reconciled; an unreconciled item shows Needs review. Review identity, condition and quantity as well as the asking price.

3. Check eligibility and outcome

Coins, currency, bullion, proof sets, comics and gems have Whatnot paths; a gem lists under Crystals & Gems and needs its Origin set (diamond simulants can't be listed). Sports cards need a recognized sport; other cards need a recognized game. Non-Sport cards and items typed Other cannot be listed; a refused item shows as failed after you list. Read the result or queue status and verify each successful listing in your Whatnot shop before treating the batch as complete.

Preview and print an item label

In Add, open **Finish** and inspect the label preview. Use **Print label on save** when you want a label with the new record. Choose the correct size and destination through your **Android print service**. For direct printing to a DYMO LabelWriter Wireless or 550, use the item's print menu (30347 labels; enter the printer's host or IP). Inspect one test label before a batch.

Scan or reconcile the record

A Reliqra QR label links back to the item. Verify the PID and physical object before marking it reconciled or Sold. If output is uncertain, inspect the printer and queue before retrying. An item label is not purchased shipping postage.

> For labels printed during a Whatnot live show, use the browser extension and Print Bridge. The apps do not print from Cloud sale sync; the extension's **Whatnot API** Sale Detection mode can, with no Whatnot tab open.

06 / PRACTICAL WORKFLOW

Tools, Lookups and help

Use the shared balance carefully and verify results before acting on a batch.

Choose the right tool

Live metal prices, metal calculators and Melt Guard support metal-value checks without using a Lookup. Review every proposed price change before applying it. Use inventory audit, reconciliation and duplicate cleanup to find records needing attention. The Discover group also has Shows, Holdings and Exchange.

Remove duplicates carefully

Keep a backup before cleanup or restore. **Tools > Duplicate Cleanup** groups items sharing a product ID. The most-complete copy is protected; age breaks ties. Inspect all copies and the marked keeper before confirming a removal. Deletions sync to your other devices, so do not use cleanup to hide an unresolved match.

Understand the plan

Free includes **500 inventory items, including Sold items** and **50 monthly Lookups**. Pro adds no fixed item cap and 500 monthly Lookups. CSV export and the ordinary selling workflow are included on Free. Check the current offer before buying. Manage Google Play subscriptions in Google Play and web subscriptions on the web.

Report an incorrect result

Open **Tools > Lookup History**. Eligible AI identification and Greysheet records offer **Report Incorrect**; other entries can remain read-only. Choose a field, enter details, or both. The entry becomes Reported after submission. A report does not automatically add a Lookup credit.

Resolve common problems

Empty inventory or wrong plan: check sign-in method, workspace and filters.
Listing blocked: resolve the readiness card's named requirement.
Wrong result: correct it before listing.
Need help: open cloud.reliqra.com > Help & Support. Include the app version and item PID, never credentials.

> Android and iOS use the same inventory account, but navigation and release timing can differ. Do not assume a newly documented feature is installed on both devices.
